Survey of Japanese Space Program with Emphasis on Kappa and Lambda Type Observation Rockets Jun 18 2021

The devices installed in a space rocket can be divided into three classes: 1) an observing device used to observe physical phenomena in a high-altitude atmosphere and a counting device used to detect the operational condition of a rocket, 2) a teletransmitter used to send observed data to the ground stations, and 3) a radar transmitter to give instantaneous information about the trajectory of a space rocket. Of course, a rocket has equipment in addition to these three fundamental devices in order to ensure all devices and the flight operating efficiently and effectively. Some special techniques are needed to obtain an effective flight for a space rocket having all those measuring and counting and communication devices on board. And some other techniques are needed to get effective operation of the measuring and communication devices. For example, we have to open a window on the nose of the rocket to expose a measuring device to the outside atmosphere, or stretch out an antenna to send radio waves to ground stations. All techniques described here will be under the general heading of device- operation techniques. In the following sections, we shall see the achievements of device- operation techniques; and the author's personal opinion on the future trend of

development in the technical field will be briefly described.

Improved Acoustical Treatment for Engine Test Stands Nov 04 2022

This report summarizes an investigation and test of improved materials, noise control devices, and methods of application to engine test stands for the purpose of reducing radiated noise and in increasing structural durability. Included are excerpts from an acoustical survey of a modified test stand and a full report of the acoustical evaluation of experimental exhaust units for a Transportable Turbojet Engine Test Stand. Experimental work was performed at Wright-Patterson Air Force Base, Ohio. (Author).

Secret Gear, Gadgets, and Gizmos Jul 08 2020 The relationship between war and science — as old as the wheel — entered a whole new realm with the Civil War, the first truly "technological" conflict. Secret Gadgets and Strange Gizmos traces this evolving connection from the deadly innovations of the Union and Confederate forces to the top secret, high-tech inventions that are making military history today. Chronicling the hits, the misses, and the important technological advances produced by the U.S. military's high-tech hubs — aviation, wireless communication, the Internet, atomic energy, satellite technology, and space travel — this richly illustrated book takes readers from the ironclads, land mines, and ship-launched hydrogen balloons of the Civil War to the world-changing bombs of the Atomic Age.
